RESEARCH INTERESTS

Understanding the exchange of carbon and water between the Earth's surface and the atmosphere is critically important for projecting the impacts of climate-carbon feedbacks in the terrestrial biosphere and informing human decision making. My research leverages natural stable isotope tracers to answer fundamental questions in the areas of vegetation-water-climate interactions including the following themes of focus: 1) hydroclimatology, 2) sensitivity of the carbon cycle in a changing climate, and 3) plant water use efficiency.
